

# SentinelOne Singularity Endpoint

Detection Strategy Guide

June 2025

## Product Overview

SentinelOne's Singularity Endpoint is an AI-powered cybersecurity platform that provides real-time protection, detection, and response for endpoints. It integrates endpoint protection, threat detection, and incident response capabilities into a single platform.

These agents have the following supported capabilities:

- Endpoint protection (antivirus)
- Response capabilities including:
  - Endpoint recorded events stored in a central cloud datastore
  - Remote Shell
- Containment capabilities including:
  - Endpoint network quarantine
  - File deny list
- Remote Shell

## Detection Strategy for Endpoint Integrations

### Detection

Our endpoint detection strategy focuses on two common signal types: process and network events. By integrating directly with EDR vendors, we can process security alerts to extract evidence and normalize event details. These normalized signals are then processed through our detection engine to look for signs of post-exploitation activity.

In addition to categorical handling of vendors' security alerts, Expel maintains a large library of behavioral detections to augment vendor detections. When a threat is detected, our automated response bot, Ruxie, takes action by enriching evidence fields with first- and third-party threat intelligence. Additional Ruxie actions query a wide span of technologies directly to arm analysts with key pieces of investigative information and related events.

### Response

Endpoints provide rich context for processes and also support other types of Expel Alerts. For example, we use source device identification across a number of alert types when a source IP or hostname is available, because it provides rich context about the actor behind the activity.

Additionally, endpoints provide valuable information for network alerts to help identify what process triggered a connection.

To learn more about our overall approach to detection strategy, see [About Detection Strategy](#) in the Help Center.

## What We Support for SentinelOne Singularity Endpoint

To see a comprehensive list of the most up-to-date Expel detection rules, vendor detection rules, opt-in detections, and available DUETs (**did you expect this**) that we support for SentinelOne Singularity Endpoint, you can visit the [Detections page](#) in Workbench or ask your Sales or Support rep for the most recent download.

<b>Supported versions</b>	<ul style="list-style-type: none"> <li>■ Iguazu and later</li> </ul>
<b>Supported platform</b>	<ul style="list-style-type: none"> <li>■ Windows</li> <li>■ Linux</li> <li>■ MacOS</li> <li>■ Cloud Workloads</li> <li>■ IoT</li> </ul>
<b>SentinelOne Singularity Endpoint detection rules support</b>	Yes.
<b>Detection rules written by Expel</b>	Yes.
<b>Investigative support through Workbench</b>	<p>Yes. We are able to take the following investigative actions to gather data for triage and investigation of events:</p> <ul style="list-style-type: none"> <li>■ Query Host</li> <li>■ Query User</li> <li>■ Query Domain</li> <li>■ Query File</li> <li>■ Query IP</li> </ul>
<b>Hunting support</b>	No. Hunting is not currently available for this integration.

## Additional Details and Common Questions

### Console Access

A vendor alert does not typically include all of the contextual timeline activity surrounding the event of interest. Because this integration does not allow us to get all necessary data via the API, we will ask you for a certain level of console access during onboarding.

The level of access that we require is meant to support essential triage and research activities, and to help us determine the vector and extent of attacker activity for an identified threat. At minimum, we will ask for visibility into alert data, timeline events recorded, and live response/real time response shell (if applicable).

### DUET

A DUET (**did you expect this**) rule flags certain events as needing an immediate verification or notification, and bypasses the normal internal event triage process. The events subject to DUET rules contain behaviors that are not typically indicative of true security incidents, as they are related to policy violations or *potential* risk.

There are a number of workflows that a DUET may follow. When enabled, the activity will be flagged for investigation and will be routed to you (rather than to us) to take a specified first action. To see the specific DUET rules currently supported for this integration, visit the [Detections page](#) in Workbench.

### Use Cases Not Supported

Use Case	Description	Why it's not supported
SentinelOne Alerts	Alerts created in SentinelOne	Alert coverage isn't part of the current implementation but may be added in the future.
