

# Cisco ASA (via SIEM)

Detection Strategy Guide

July 2025

## Product Overview

The Cisco ASA (Adaptive Security Appliance) is a line of network security devices from Cisco Systems that integrates multiple essential security functions into a single platform. Primarily known for its robust stateful firewall capabilities, it acts as a network barrier controlling traffic flow. Additionally, many ASA models incorporate advanced threat defense features like Intrusion Prevention System (IPS) and malware protection, making it a versatile tool for network perimeter security and secure access.

## Detection Strategy for Network Integrations

### Detection

Network traffic monitoring is a critical element of our detection strategy, offering insight into the activity of data as it moves across an organization's systems. The network traffic data source focuses on network connection creation (the initial construction of a network connection such as socket information, and src and dst IP and Ports ), network traffic content (logged network traffic data showing both protocol header and body values like PCAP), and network traffic flow (summarized network packet data, with metrics, such as protocol headers and volume like netflow or http logs).

We pull this information into our detection pipeline as events in the form of both security alerts and raw telemetry (depending on the integration). When a threat is detected, our automated response bot, Ruxie, takes action by enriching evidence fields with first- and third-party threat intelligence. Additional Ruxie actions query a wide span of technologies directly to arm analysts with key pieces of investigative information and related events.

### Response

Network technologies are utilized for support across many types of Expel Alerts such as endpoint and cloud. The main focus of the response strategy is on source IP, destination IP, and domain tracking to identify related connections, along with user activity summaries to give extra alert context.

To learn more about our overall approach to detection strategy, see [About Detection Strategy](#) in the Help Center.

## What We Support for Cisco ASA (via SIEM)

To see a comprehensive list of the most up-to-date Expel detection rules, vendor detection rules, opt-in detections, and available DUETs (did you expect this) that we support for Cisco ASA (via SIEM), you can visit the [Detections page](#) in Workbench or ask your Sales or Support rep for the most recent download.

<b>Supported versions</b>	<ul style="list-style-type: none"> <li>Requires Sumo Logic</li> </ul>
<b>Supported platforms</b>	<ul style="list-style-type: none"> <li>N/A</li> </ul>
<b>Cisco ASA (via SIEM) detection rules support</b>	No.
<b>Detection rules written by Expel</b>	No.
<b>Investigative support through Workbench</b>	<p>Yes. We are able to take the following investigative actions to gather data for triage and investigation of events.</p> <ul style="list-style-type: none"> <li>Query IP</li> <li>Query Netflow</li> </ul>
<b>Hunting support</b>	No. Hunting is not currently available for this integration.

## Additional Details and Common Questions

### Console Access

A vendor alert does not typically include all of the contextual timeline activity surrounding the event of interest. Because this integration does not allow us to get all necessary data via the API, we will ask you for a certain level of console access during onboarding.

The level of access that we require is meant to support essential triage and research activities, and to help us determine the vector and extent of attacker activity for an identified threat. At minimum, we will ask for visibility into alert data, timeline events recorded, and live response/real time response shell (if applicable).

## DUET

A DUET (**did you expect this**) rule flags certain events as needing an immediate verification or notification, and bypasses the normal internal event triage process. The events subject to DUET rules contain behaviors that are not typically indicative of true security incidents, as they are related to policy violations or *potential* risk.

There are a number of workflows that a DUET may follow. When enabled, the activity will be flagged for investigation and will be routed to you (rather than to us) to take a specified first action. To see the specific DUET rules currently supported for this integration, visit the [Detections page](#) in Workbench.
